Python Lesson 3

Conditionals

Review: What does this code do?

```
import random
num1 = random.randint(1, 100)
num2 = random.randint(1, 100)
print("I picked the random number", max(num1, num2))
```

Conditionals: Introduction

If it rains tomorrow, I will bring an umbrella.

- What happens if it rains?
- What happens if it is sunny?

Conditionals: Booleans

A boolean has the value of either **True** or **False**.

<code>print(4 > 3)</code>	True	<code>print(3 == 3)</code>	True
<code>print(4 > 5)</code>	False	<code>print(3 == 4)</code>	False
<code>print(3 >= 3)</code>	True	<code>print(3 != 3)</code>	False
<code>print(3 < 4)</code>	True	<code>print(3 != 4)</code>	True
<code>print(3 < 2)</code>	False	<code>print("Hello" == "Hello")</code>	True
<code>print(3 <= 3)</code>	True	<code>print("Hello" == "World")</code>	False
		<code>print("Hello" != "Hello")</code>	False
		<code>print("Hello" != "World")</code>	True

**`==` and `!=` tell the program you are comparing two values.
The comparison produces a Boolean value.**

Conditionals: Booleans

What does the following code do?

```
x = 10
y = 5
print(x == y)    False
print(x != y)    True
print(x < y)      False
print(x > y)      True
```

```
x = "apple"
y = "orange"
z = "apple"
print(x == y)    False
print(x != y)    True
print(x == z)    True
print(y == z)    False
```

Conditionals: If Statements

What does this code do?

```
import random

print("Flipping coin!")
coinToss = random.randint(0,1)
if coinToss == 0:
    print("You flipped heads!")
```

Anatomy of If Statements

if tells the program you are starting a conditional statement.

A condition that evaluates to either **True** or **False**.

: tells the program you are starting the statements block.

```
if coinToss == 0:  
    print("You flipped heads!")
```

The statements must all be indented the same amount.

The statements get executed only if the condition is **True**.

Conditionals: Else Statements

If it rains tomorrow, I will bring an umbrella. Otherwise, I will bring a pair of sun glasses.

- What happens if it rains?
- What happens if it is sunny?

Conditionals: Else Statements

What does this code do?

```
import random

print("Flipping coin!")
coinToss = random.randint(0,1)
if coinToss == 0:
    print("You flipped heads!")
else:
    print("You flipped tails!")
```

Anatomy of Else Statements

else tells the program you want to execute the statements if the condition is **False**.

```
if coinToss == 0:  
    print("You flipped heads!")  
else:  
    print("You flipped tails!")
```

: tells the program you are starting the statements block.

The statements must all be indented the same amount.

The statements get executed only if the condition is **False**.

Recap

- A Boolean has the value of either **True** or **False**.
- `==` is for comparison. `=` is for value assignment.
- To write conditional statements,
 - if Boolean expression:*
 - statements*
 - else:*
 - statements*
- All the statements inside a code block should be indented the same amount.
