

Week 1 In-class Challenge

Challenge

You will learn next week about `input`, which allows you to store a string the user provides in a variable. For example:

```
favorite_color = input("Tell me your favorite color: ")
```

will output

```
Tell me your favorite color:
```

and wait for the user to type something and press Enter. If the user types red, then effectively,

```
favorite_color = "red"
```

Use `input` to implement Mad Libs. An example Mad Lib is provided below, but feel free to create or find your own!

```
Roses are ____ (adjective) ____  
____ (noun) are blue  
____ (noun) is ____ (adjective) ____  
And so are you!
```
